DECKING

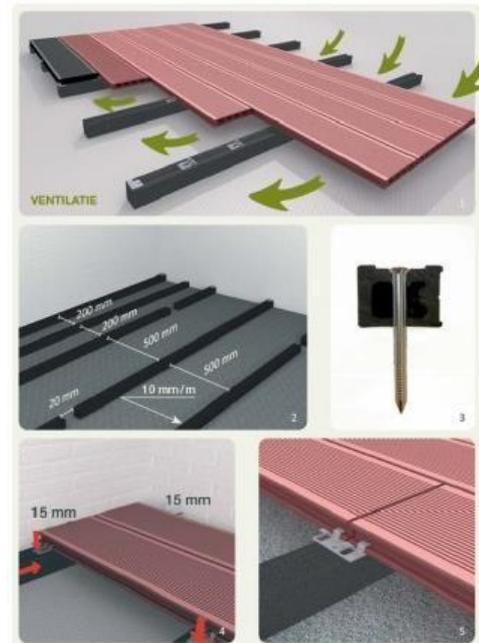

GROUND

- It is essential that sufficient ventilation (1) is provided under the boards so that they can dry after a shower.
- The ground has to be flat and stable.
- For a good evacuation of water the ground has to have a slope of 10mm every meter (2) in the direction of the board and preferably away from the house. This slope has to be maintained on the board so that the drainage of the water is optimized and no water can remain on, in or under the board.

FIXING OF THE BEAMS

- The decking is installed on beams. Align all beams, so that the starter clips can be fixed at the front of every beam.
- The distance between the beams is a maximum 500mm. Install an extra beam at 200mm distance from the first and the last beam at the beginning and at the end of the decking.
- Beams need to be fixed on the concrete foundation or on a supporting structure every 500mm in the correct way (2).
- Use a countersink to make the holes conical so that the screws and plugs are sunk (3).
